

Implementing Cloud Databases

The aim for this lab is to get some hands-on experience with configuring and deploying cloud databases. As you have seen from the lecture all the main cloud providers have services for provisioning cloud databases of many different type/flavors (e.g. Oracle, MySQL, MongoDB etc.).

- Using the lecture notes, create a MySQL cloud database on each of the cloud platforms (AWS, Google, Azure).
- Once you have created the database connect to it from MySQL Workbench and implement a simple database. There is a simple SQL script on Moodle that you can use to generate a simple database.

! Remember to stop/delete any DB instances you create to avoid incurring charges.
